Introduction

This report contains physical and financial data from 52 farms and includes data from the South East Coastal, Darling Downs and North Queensland dairy regions (Figure 1).

Milk production in Queensland increased by 13 million litres from 405 million litres in 2015-16 to 418 million litres in 2016-17, see Table 1. This increase was due to improved seasonal conditions in a year where Australia’s milk supply decreased dramatically due to low prices in southern Australia.

In 2016-17 Australian milk production was 9.0 billion litres with Queensland contributing 4.6% of this.

Figure 2 shows Queensland’s monthly milk production for 2015-16 and 2016-17.

A thorough analysis of Queensland dairy businesses can be undertaken by reviewing performance using four business traits – liquidity, profitability, solvency and efficiency. These traits cover both the financial and physical aspects of the business.

Section 1 of this report presents a summary of the key findings. Three business traits – profitability, solvency and efficiency, were used to measure farm performance. The results for these traits are presented using 15 key performance indicators.

Section 2 displays the distribution of the Queensland Dairy Accounting Scheme (QDAS) data for cow numbers, land area, labour, production, receipts, costs and profitability.

Section 3 details the characteristics of the most profitable farms in QDAS. Production per cow, the effect of herd size and milk from home grown feed are examined.

Section 4 details the amounts fed to milking cows in each of the regional production systems.

Regional production system statistics are summarised in Section 5 and are then examined individually in Sections 6 to 9.

Appendices contain summary reports for all QDAS farms, the top 25% farms and each regional production system. The appendices also contain a list of definitions for the business traits and key performance indicators used in QDAS.

Figure 1. The location of dairy farms in Queensland

Table 1. Annual milk production for Queensland (2013-14 to 2016-17)

| | Annual production |
|----------------|-------------------|
| 2013-14 | 433 m L |
| 2014-15 | 411 m L |
| 2015-16 | 405 m L |
| 2016-17 | 418 m L |

Figure 2. Queensland monthly milk production (2015-16 and 2016-17)

Objectives

The objectives of this book are to:

- Provide QDAS participants with a summary of physical and financial data from each regional production system. This, together with their own farm reports, will give dairy farming families/enterprises information that will enable them to make more informed business decisions.
- Act as a resource guide for local advisers, consultants and other industry service personnel who wish to encourage positive change.
- Provide background material for industry participants negotiating with banks, governments, suppliers or other agents.

About QDAS

QDAS was established to improve the understanding of business principles among advisors and dairy farmers by providing farm management accounting and analysis. Originally the basis of the analysis was an examination of the annual variable costs. The data were used to answer questions such as “Is the production of an extra unit of milk profitable?” QDAS has evolved to now examine the business traits of profitability, solvency and efficiency but still maintains a similar aim to help dairy farmers make informed decisions based on business information.

Officers of the Department of Agriculture and Fisheries (DAF) supervise the collection and processing of data between August and November.

Farmer participation in QDAS is voluntary and free. Results and trends need to be interpreted carefully as QDAS farms have larger herds and produce more milk per farm than the Queensland average.

QDAS data is used by DairyBase, Dairy Australia’s web based farm comparative analysis tool, as their verified farm data for Queensland. Using DairyBase, farmers can calculate their financial performance and compare this to averages for Queensland (QDAS data) or verified data from other states. For more information go to: www.dairybase.com.au.

Acknowledgements

The authors wish to thank all cooperating farmers who supplied data and provided valuable feedback in discussion groups held during late 2017.

The author also acknowledges the support and efforts of Howard Smith for his assistance with data collection.

QDAS is a project of the Department of Agriculture and Fisheries (DAF) and is co-funded by DAF and Dairy Australia.

1. 2016–17 Key findings

Fifteen Key Performance Indicators (KPI) are used to highlight the results for profitability, solvency and efficiency. Table 2 shows these results for 2016-17 and the preceding three years. Further to this is the calculation of these KPI for the top 25% of farms. These top farms have been identified as the farms with the highest dairy operating profit measured in dollars per cow.

Dairy operating profit highlights the amount of profit retained after paying all expenses except finance costs and taxes. These expenses include

the non-cash items of depreciation and an allowance for the manager's time and skill (called imputed labour). Cattle trading profit and inventory adjustments are also included.

Table 2 has been presented to show the general industry trend. The participating farms have not been selected randomly. If using this data to compare with an individual farm situation, consideration needs to be given to the individual's position in the business lifecycle, personal goals, farming system and asset base.

Table 2. Financial and performance ratios for QDAS farms (2013-14 to 2016-17)

| Business traits and indicators ⁽¹⁾ | Top 25% | QDAS average | Past QDAS averages | | |
|---|----------------|----------------|--------------------|---------|---------|

| Production per cow (L) | 6,946 | 6,266 | 6,121 | 6,088 | 5,927 |
| Litres per labour unit | | | | | |
| - On farms <1.0 m L | 384,500 | 329,004 | 358,425 | 354,504 | 335,874 |
| - On farms >1.0 m L | 519,940 | 494,488 | 493,543 | 500,861 | 470,132 |

⁽¹⁾ The definition of each indicator and how it is calculated can be found in Appendix 10.10

Profitability

The profitability of Queensland dairy farms has been relatively stable for the past three years. Table 2 shows that dairy operating profit per cow was \$606 in 2014-15, \$770 in 2015-16 and has decreased slightly to be \$758 in 2016-17. Average return on assets managed on QDAS farms remained at the 2015-16 result of 4.4%.

This profit result was influenced by several contrasting factors. Firstly, the cost of purchased feed decreased by 1.4 c/L which flowed through to a decrease in feed related costs (which includes the home grown feed costs) of 1.8 c/L. Secondly a 0.9 c/L decrease in average milk receipts. Finally, the imputed cost for unpaid family labour increased by 0.7 c/L due to an increase in the cost QDAS allocates to each unpaid labour unit.

Cattle trading profit increased slightly from 6.2 c/L in 2015-16 to 6.4 c/L in 2016-17. However, the make-up of this profit has changed. In 2015-16, 2.7 c/L of the cattle trading profit was achieved through an increase in cattle inventory. In 2016-17 cattle inventory increased by only 1.4 c/L but cattle sales less purchases increased from 3.5 c/L to 5.0 c/L as farmers took advantage of high cattle prices.

Extreme weather

A hot dry February was followed by cyclone Debbie who damaged central Queensland and then flooded south east Queensland and northern NSW in March. Beaudesert's average rainfall for February is 117mm and March is 116mm. In 2017 Beaudesert received only 10mm of rain in February and that was followed by 541mm in March. The cyclone dumped 344mm of rain on Beaudesert in two days causing damaging flooding.

Figure 3. Change in milk production on individual farms between 2015-16 and 2016-17

Production and prices

The 13 million litre increase in Queensland's milk supply in 2016-17 was reflected on QDAS farms with the average milk supplied by QDAS farms increasing by 122,383 litres to 1,680,243 litres. This increase was a result of an increase in production per cow and the average number of milking and dry cows increasing from 255 to 268.

The milk production changes on individual farms are varied, with three QDAS farms increasing production by more than 500,000 litres and three farms decreasing production by 200,000 litres or more. Figure 3 shows the changes in milk production between 2015-16 and 2016-17 for individual QDAS farms.

QDAS average milk receipts (milk price) decreased by 0.9 c/L. This was caused by two factors. Firstly, protracted negotiations between farmers and a milk processor resulted a reduction in milk receipts. Secondly, an increase in spring milk production resulted in a slight drop in butterfat and protein percentages and a decrease in milk receipts on a cents per litre basis.

Figure 4 shows the changes in average milk receipts per litre between 2015-16 and 2016-17 for individual QDAS farms. The farm with the large increase in milk receipts was the result of overcoming milk quality issues that has decreased milk receipts in the previous year.

Production per cow

Table 2 shows that production per cow has increased consistently from 5,927 litres in 2013-14 to 6,266 litres in 2016-17. The top 25% farms achieved a production per cow 680 litres higher than the QDAS average in 2016-17.

Figure 4. Change in average milk receipts on individual farms between 2015-16 and 2016-17

Production costs

Feed related costs decreased by 1.8 c/L, from 28.9 c/L in 2015-16 to 27.1 c/L in 2016-17. This change is primarily due to a decrease in the cost of purchased feeds, with the price of grain remaining low for most of the year. The spot price of grain did increase dramatically in the last few months of 2016-17 but most farmers were using grain at lower contracted prices. The higher grain prices will increase purchased feed costs in 2017-18. Table 3 shows the prices of major farm inputs. These prices are sourced in southern Queensland and vary depending on contractual arrangements.

The margin over feed related costs increased by 0.9 c/L, from 30.2 c/L to 31.1 c/L. The margin over feed related costs per cow increased from \$1,848 to \$1,951.

The top 25% group (sorted by dairy operating profit per cow) achieved feed related costs of 26.0 c/L. This is 1.1 c/L lower than the average of all farms. This underlines the importance of feed costs, which consume 46% of milk receipts.

The operating cash surplus for the top 25% group was 24.5 c/L, which is 4.5 c/L higher than the average of all farms. On individual farms in the top 25% group, the operating cash surplus ranged from 14.0 c/L to 33.8 c/L.

Table 4 shows the cash receipts and cash costs of production for QDAS farms for 2016-17. Full details of QDAS average cash receipts and cash costs can be found in Appendix 10.1.

Table 3. Indicative prices per tonne of major farm inputs (June 2014 to June 2017)

| | June 2014 | June 2015 | June 2016 | June 2017 |
|---------------------|-----------|-----------|-----------|-----------|
| Concentrates | | | | |
| Sorghum | \$300 | \$340 | \$235 | \$285 |

| Soybean meal | \$720 | \$620 | \$660 | \$580 |
| Canola meal | \$550 | \$510 | \$480 | \$480 |
| 14% dairy pellet | \$430 | \$410 | \$400 | \$420 |
| Fertiliser | | | | |
| Urea | \$565 | \$535 | \$460 | \$650 |
| Diesel | | | | |
| Bowser price | \$1.60 | \$1.39 | \$1.25 | \$1.26 |

Table 4. Cash analysis of the costs of production (2016-17)

| | c/L |
|------------------------------|-------------|
| Farm receipts | |
| Milk receipts (Net) | 58.2 |
| Other farm receipts | 7.0 |
| Total farm receipts | 65.2 |
| Production costs | |
| Purchased feed | 19.5 |
| Home grown feed | 7.6 |
| Total feed related costs | 27.1 |
| Herd costs | 2.8 |
| Shed costs | 1.9 |
| Employed labour | 7.3 |
| Repairs & maintenance | 3.5 |
| Other overheads | 2.6 |
| Farm working expenses | 45.2 |
| Interest, principal, lease | 7.0 |
| Owners labour | 6.0 |
| Total cash costs | 58.3 |
| Surplus / Deficit | 6.9 |

Labour

Average paid labour costs are \$122,914 for 2.0 labour units. This equates to 7.3 c/L, which is 0.9 c/L higher than in 2015-16. As farms milk more cows there are opportunities to utilise labour more effectively. Table 5 shows that farms producing less than 1.0 m L (131 cows) do so at 329,004 litres per labour unit, whereas farms producing more than 2.0 m L (449 cows) do so at 515,301 litres per labour unit.

Table 5 also shows the increase in labour used, both paid and unpaid (family), as production increases. It is not surprising that the greater than 2.0 m L group has the largest use of paid labour at 4.1 full time equivalents (FTE). This is more than double the paid labour use of the 1.5 m L to 2.0 m L group.

Repairs and other overhead

The QDAS average repairs and maintenance is \$58,988 (3.5 c/L). Table 5 shows that repairs and maintenance is 4.5 c/L for the farms that produce less than 1.0 m L and 3.2 c/L for the farms that produce more than 2.0 m L of milk.

The QDAS average for other overhead costs is \$43,789 (2.6 c/L). While overhead costs increase as production increases, the costs get proportionately lower per litre. Table 5 shows other overhead costs falling from 3.6 c/L to 2.2 c/L as production increases. Other overhead costs include rates, insurance, registration, office expenses, accounting, industry levies and telephone.

Table 5. Analysis of overhead costs (2016-17)

| | <1.0 m L | 1.0 – 1.5m L | 1.5 – 2.0m L | >2.0m L |
|--|----------|--------------|--------------|-----------|
| Milk production (L) | 688,562 | 1,241,211 | 1,665,029 | 3,098,391 |
| Cows (milkers + dry) | 131 | 227 | 266 | 449 |
| Overheads | | | | |
| Repairs & Maintenance (\$) | 30,695 | 55,695 | 46,537 | 99,274 |
| Repairs & Maintenance (c/L) | 4.5 | 4.5 | 2.8 | 3.2 |

Figure 16. The distribution of QDAS farms by liabilities per cow

3. Factors affecting profitability

To investigate the factors affecting profitability, the QDAS results of the top 25% group (sorted by dairy operating profit per cow) are compared with the results of the remaining 75% of farms. Table 6 shows these results.

The higher dairy operating profit per cow achieved by the top 25% group is directly linked to the following profit drivers:

- Higher production per cow. The top 25% group produced 1,026 litres per cow more than the remaining 75% group.
- Selling more litres of milk. The top 25% group sold 1,103,063 more litres of milk than the remaining 75% group. This is driven by production per cow and by having 124 more cows (milkers and dry).
- Higher milk receipts. The top 25% group received 1.7 c/L more for their milk which was due to processor payment structures and rewards for quality and volume.
- Lower feed related costs. The top 25% group had feed related costs 1.7 c/L lower than the other group. The margin over feed related costs is 3.3 c/L higher.
- Better labour efficiency. The top 25% group achieved 75,243 more litres per labour unit.

Table 6. KPI for top 25% and the remaining 75% of farms (2016-17)

| | Top 25% | Remaining 75% |
|-----------------------------------|-----------|---------------|
| Physical traits | | |
| Cows (milkers + dry) | 361 | 237 |
| Farm production (L) | 2,507,540 | 1,404,477 |
| Efficiency - Physical | | |
| Production per cow (L) | 6,946 | 5,920 |
| Milk from home grown feed (L/day) | 11.6 | 10.1 |
| Litres per labour unit | 515,656 | 440,413 |
| Profit Analysis | | |
| Dairy operating profit (\$/cow) | 1,370 | 439 |
| Average investment (\$/cow) | 13,605 | 13,144 |
| Cash Analysis | | |
| Milk receipts (c/L) | 59.3 | 57.6 |
| Feed related costs (c/L) | 26.0 | 27.7 |
| Total variable costs (c/L) | 30.0 | 32.9 |
| Margin over FRC (c/L) | 33.2 | 29.9 |
| Margin over FRC (\$/cow) | 2,307 | 1,770 |

Production per cow

QDAS reports have always shown that farms with higher production per cow have higher profitability. Table 7 shows that as production per cow increases from below 5,000 litres to above 7,000 litres profits increase. Interestingly, it is the larger farms that are achieving the highest production per cow.

Dairy operating profit per cow increased from \$411 to \$1,169 as production per cow increased.

The margin over feed related costs per litre is the highest in the <5,000 litres group, while the margin over feed related costs per cow is highest in the >7,000 litres group.

Table 7. KPI for four production (L per cow) groups in Queensland (2016-17)

| | <5,000 | 5,000 - 6,000 | 6,000 - 7,000 | >7,000 |
|--|---------|---------------|---------------|-----------|
| Farm milk production (L) | 837,103 | 1,410,653 | 1,689,187 | 2,796,206 |
| Cows (milkers + dry) | 197 | 252 | 259 | 365 |
| Production per cow (L) | 4,255 | 5,598 | 6,527 | 7,669 |
| Milk receipts (c/L) | 59.5 | 59.0 | 58.4 | 57.1 |
| Margin over FRC (c/L) | 36.6 | 30.8 | 32.4 | 29.2 |
| Margin over FRC (\$/cow) | 1,555 | 1,723 | 2,116 | 2,238 |
| Dairy operating profit (\$/cow) | 411 | 500 | 808 | 1,169 |

Herd size

An important profit driver is the scale of operation. Table 8 shows the effect that increasing herd size has on profitability indicators.

Increasing the scale of a farm's operation can lead to efficiencies in overheads and the use of labour. The farms with more than 320 cows (milkers and dry) had the highest production per cow at 6,769 litres, whereas the farms with less than 150 cows produced 5,634 litres per cow.

The larger herds have the highest margin over feed related costs per cow. This is an indicator of

their attention to detail and recognition of the need for efficient feeding systems.

Labour usage was excellent in the larger herds with 507,308 litres produced per labour unit. Labour efficiency dropped to 332,784 litres per labour unit in the smaller herds.

With a dairy operating profit of \$949 per cow, the farms with more than 320 cows had the highest dairy operating profit per cow. The group with less than 150 cows recorded the lowest dairy operating profit per cow.

Table 8. KPI for farms with increasing cow numbers (2016-17)

| | < 150 | 150 - 240 | 240 - 320 | > 320 |
|--|---------|-----------|-----------|-----------|
| Farm milk production (L) | 659,629 | 1,069,002 | 1,658,947 | 3,142,412 |

| Production per cow (L) | 5,634 | 5,337 | 6,275 | 6,769 |
| Margin over feed related costs (\$/cow) | 1,810 | 1,735 | 1,923 | 2,082 |
| Litres per labour unit | 332,784 | 426,093 | 481,749 | 507,308 |
| Return on assets managed (%) | 1.3 | 3.2 | 4.2 | 5.9 |
| Dairy operating profit (\$/cow) | 259 | 578 | 713 | 949 |

4. Feed analysis

Feed related costs require significant attention by dairy farmers, especially in a subtropical environment. In 2016-17 feed related costs represented 46% of milk receipts on the QDAS average farm. On Darling Downs total mixed ration (TMR) farms it represents 55% of milk receipts. In 2013-14, a year affected by drought, feed related costs represented 69% of milk receipts on Darling Downs TMR farms.

QDAS allows farmers to investigate their feeding system and compare their feed inputs and milk responses with other farmers from the same regional production system. Table 9 shows the amount of various feeds, fed to milking cows over the 2016-17 year.

Milk responses are allocated to each concentrate and conserved forage fed to milking cows to determine the milk produced from these feed sources. The remaining milk produced is then assumed to be as a result of grazing and the tonnes of dry matter required to be grazed to produce this milk is calculated.

The calculation of total intake (kgDM/cow/day) and milk production (L/cow/day) in Table 9 assume a 300 day lactation.

Grain used on-farm is predominately wheat, barley and maize. Custom made pellets are popular on farms with no grain milling equipment.

Protein is fed mainly as canola meal and soybean meal on partial mixed ration (PMR) and TMR farms. Whole cottonseed is a popular protein supplement on north Queensland farms.

Molasses is a significant feed, especially in north Queensland. Distillers Syrup is used on several TMR farms on the Darling Downs.

The largest contribution to “other concentrates” is from brewer’s grain. Bread and flour are also fed in significant amounts on some PMR and TMR farms.

Good quality silages include maize, cereals, legumes and ryegrass. Medium quality silages include forage sorghum and tropical grasses. No one should ever make poor quality silage.

Good quality hays are predominately lucerne or cereals. Medium quality hays are mainly forage sorghum, millet and tropical grasses. Straw is also an important fibre source on some farms.

Table 9. Amounts fed to milking cows in each of the regional production systems (2016-17)

| | Sth East Coastal Grazing | Sth East Coastal PMR | Darling Downs TMR | North Qld Grazing | All Qld |
|--|---------------------------------|-----------------------------|--------------------------|--------------------------|----------------|

| Total intake (kgDM/cow/day) | 17.7 | 20.7 | 21.8 | 18.3 | 20.2 |
| Production (L/cow/day) | 18.7 | 21.2 | 22.5 | 19.0 | 20.9 |
| Feed Conversion Efficiency (L/kgDM) | 1.06 | 1.02 | 1.03 | 1.04 | 1.03 |
| Forage to concentrate ratio | 60:40 | 60:40 | 52:48 | 61:39 | 59:41 |

5. Production system analysis

QDAS data collection concentrates on gaining a “snap-shot” into different production systems in the regions. The three systems are:

Grazing (GRA) – Milk production principally from grazing, with grain and concentrates fed in the dairy. Less than 10% of dry matter intake is from hay or silage.

Partial Mixed Ration (PMR) – Milk production from a combination of grazing, grain, concentrates, hay and silage. More than 10% of dry matter intake is from hay or silage and at least 1% of dry matter intake is from grazing.

Total Mixed Ration (TMR) – Milk production principally from a silage based mixed ration fed on a pad. Less than 1% of dry matter intake is from grazing.

Table 10 shows the distribution of the participating QDAS farms among the regional production systems. No reports are generated for a regional production system when less than five farms are surveyed in that system.

Table 10. The number of farms collected in each regional production system (2016-17)

| Region | GRA | PMR | TMR | Total |
|--------------------|-----|-----|-----|-------|
| North Queensland | 10 | 1 | 0 | 11 |
| Darling Downs | 2 | 4 | 8 | 14 |
| South East Coastal | 12 | 15 | 0 | 27 |
| Total | 24 | 20 | 8 | 52 |

Table 11 presents a summary of the KPI for each regional production system. There are several points of interest.

- Milk receipts vary from 56.8 c/L for Darling Downs TMR farms to 59.5 c/L for South East Coastal Grazing farms. The majority of the South East Coastal Grazing farms are paid on a milk solid basis and over time have increased their milk solids percentage and therefore milk receipts per litre.
- Production per cow increases as the feeding system intensifies. The grazing farms in South East Coastal and North Queensland achieved 5,612 L/cow and 5,706 L/cow. The South East Coastal PMR farms averaged 6,357 L/cow while the Darling Downs TMR farms achieved 6,737 L/cow.
- South East Coastal PMR farms achieved the highest dairy operating profit of \$808/cow. The dairy operating profit of the North Queensland grazing farms was the lowest at \$374/cow, driven by a 2.5 c/L increase in purchased feed costs.

This data should not be interpreted as a definitive guide for changing a farming system. It should be noted that even if a regional production system is shown here to be more profitable, the skills, infrastructure and resources required on alternative systems are quite different. Farmers contemplating a change should seek help with the phasing and sizing of that change.

Table 11. KPI for farming systems (2016-17)

| | Sth East Coastal Grazing | Sth East Coastal PMR | Darling Downs TMR | North Qld Grazing |
|---|-----------------------------|-------------------------|----------------------|----------------------|
| Cows (milkers + dry) | 223 | 307 | 370 | 201 |
| Farm production (L) | 1,252,314 | 1,948,748 | 2,489,409 | 1,148,144 |
| Production per cow (L) | 5,612 | 6,357 | 6,737 | 5,706 |
| Milk receipts (c/L) | 59.5 | 58.4 | 56.8 | 59.2 |
| Feed related costs (c/L) | 25.2 | 25.9 | 31.4 | 28.6 |
| Total variable costs (c/L) | 30.8 | 30.1 | 35.0 | 36.4 |
| Margin over feed related costs (c/L) | 34.2 | 32.5 | 25.5 | 30.6 |
| Dairy operating profit (\$/cow) | 741 | 808 | 643 | 374 |
| Return on assets managed (%) | 4.2 | 4.6 | 4.2 | 2.2 |

6. South East Coastal - Grazing

Farms obtaining a large proportion of their milk from grazing and which are located in the areas of Beaudesert, Moreton, Brisbane Valley and Gympie have been grouped under the heading of South East Coastal. These areas have higher and more reliable rainfall and have a higher proportion of irrigation than the Darling Downs farms. Permanent summer pastures are mainly kikuyu, panics and setaria with irrigation areas planted to ryegrass, clover and lucerne. Kikuyu pastures are also oversown to winter forages with grazing crops of forage sorghum and oats also grown. Grain and molasses are readily available as supplements, fed at milking time.

The farms in this group have invested \$13,825 per cow in their operation, of which 73% is in the land value. Equity levels are high, averaging at 80%, and a return on assets managed of 4.2% was achieved.

Table 13 shows the data trends for farms with continuous participation in QDAS over the last four years (2013-14 to the present). This sample of farms is slightly smaller than the sample used in Table 12. There are several points of interest:

- Milk receipts have decreased from a high of 59.0 c/L in 2015-16 to 57.8 c/L in 2016-17.
- Cow numbers have stayed between 198 and 201 over these four years.
- Production per cow has stayed between 5,384 and 5,448 over these four years.
- Feed related costs were highest in 2014-15.
- Dairy operating profit increased each year to be \$845 per cow in 2015-16 but decreased to \$676 per cow in 2016-17.

| Dairy operating profit (\$/cow) | 310 | 591 | 845 | 676 |

7. South East Coastal - PMR

South East Coastal PMR farms are located alongside the grazing properties in this region. They have the ability to grow similar forages to the prior group, but supplement their milkers with silage made from maize, sorghum, lucerne and/or ryegrass.

These farms have a higher investment in stock and plant. This production system usually results in higher production per cow than that of grazing farms.

The farms in this group have invested \$11,323 per cow in their operation with 63% tied to the land. Equity levels are high, averaging at 82% and a return on assets managed of 4.6% was achieved.

Table 15 shows the data trends for farms with continuous participation in QDAS over the last four years (2013-14 to the present). This sample of farms is slightly smaller than the sample used in Table 14. There are several points of interest:

- Milk receipts have increased each year to 59.2 c/L in 2015-16 but decreased to 58.6 c/L in 2016-17.
- Cow numbers were quite stable from 2013-14 to 2015-16, but have jumped to 286 in 2016-17.
- Production per cow was also stable from 2013-14 to 2015-16, but has jumped to 6,225 in 2016-17.
- Feed related costs are lowest in 2016-17 at 25.8 c/L.
- Dairy operating profit is highest in 2016-17 at \$708 per cow.

| Dairy operating profit (\$/cow) | 277 | 561 | 556 | 708 |

8. Darling Downs - TMR

The majority of the TMR farms are located north of the Warrego Highway and are mostly dryland farms with large cropping areas. Most farmers concentrate on growing large volumes of summer forages for silage. Winter crops are opportunistic in years when sub-soil moisture is available. In years of average or above average rainfall they grow all their own forage requirements.

These farms have commodity sheds. Grain, by-products and protein meals are purchased in bulk and forward contracting is common. They are ideally situated in relation to the grain growing areas of Queensland which reduces freight costs on grain. It is common to feed up to 12 -14 kilograms of concentrate per cow per day.

They have invested \$12,356 per cow in their operation with 58% tied to the land. With the large investment in infrastructure that is required, they have a high debt per cow of \$4,441 and equity of 64%, the lowest equity of all groups. A return on assets managed of 4.2% was achieved.

Table 17 shows the data trends for farms with continuous participation in QDAS over the last four years (2013-14 to the present). This sample of farms is slightly smaller than the sample used in Table 16. There are several points of interest:

- Milk receipts have increased each year to be 58.4 c/L in 2015-16.
- Cow numbers have increased from 321 in 2013-14 to 368 in 2016-17.
- Production per cow was above 7,000 litres for two years and below 6,700 for the other years.
- Feed related costs were very high in 2013-14 and 2014-15.
- Dairy operating profit is highest in 2015-16.

| Dairy operating profit (\$/cow) | 82 | 411 | 969 | 673 |

9. North Queensland - Grazing

These farms are located in tropical North Queensland around the areas of Malanda, Millaa Millaa and Ravenshoe.

Grazing with grain fed in the dairy is the predominant production system in the tropics. This means the upper limit for daily grain intake is 6-8 kg. Some farms feed whole cottonseed and many feed rhodes grass hay for limited periods.

The farms in this group have invested \$15,117 per cow in their operation, of which 72% is in the land value. Equity levels are high, averaging 85%, and a return on assets managed of 2.2% was achieved.

Feed concentrates are more expensive (due to the freight component) than in the South East Coastal and Darling Downs systems.

Table 19 shows the data trends for farms with continuous participation in QDAS over the last four years (2013-14 to the present). This sample of farms is slightly smaller than the sample used in Table 18. There are several points of interest:

- Milk receipts have increased each year to be 58.7 c/L in 2016-17.
- Cow numbers have stayed between 199 and 202 over the first three years and increased to 208 in 2016-17.
- Production per cow has been above 5,800 litres for the past two years.
- Feed related costs were the highest in 2014-15.
- Dairy operating profit per cow was highest in 2015-16.

10.10 Business traits, key performance indicators and definitions

Key performance indicators (KPI) are used in QDAS to monitor farm performance. Table 20 shows these indicators grouped under the three key business trait headings:

- Solvency
- Profitability
- Efficiency

A further business trait, liquidity, is essential to measuring a business' ability to meet short term debts. QDAS does not report on this business trait as it concentrates its efforts into the longer term business traits.

Why use KPI

Put simply, a KPI is a calculation used for measurement, comparison and evaluation. Their use eliminates many simple dollar value comparisons, which can often be misleading and confusing. They can also be used to identify problems and opportunities.

Table 20. Key performance indicators used in QDAS

| |
|---|
| <p>Profitability</p> <ul style="list-style-type: none"> • Return on asset managed – % • Return on equity – % • Operating profit margin – % • Dairy operating profit –\$/cow <p>Solvency</p> <ul style="list-style-type: none"> • Equity% – % • Debt to equity ratio <p>Efficiency - Capital</p> <ul style="list-style-type: none"> • Asset turnover ratio • Total liabilities per cow – \$/cow • Interest per cow – \$/cow <p>Efficiency - Production</p> <ul style="list-style-type: none"> • Feed related cost – c/L • Margin over feed related costs – \$/cow • Total variable cost – c/L • Gross margin milk – \$/cow <p>Efficiency – Physical</p> <ul style="list-style-type: none"> • Litres of milk from home grown feed • Production per cow – Litres • Litres per labour unit |
|---|

Profitability KPI used in QDAS

Profitability ratios measure the ability of the business manager to generate a satisfactory profit. These ratios are typically a good indicator of management's overall effectiveness in producing milk from the land and stock.

Return on asset managed - operational

This measures the profit generating capacity of the total assets managed by the business. It measures the farm's effectiveness in using the available total assets (owned, financed and leased). This does not include any capital (land and improvements) appreciation.

Calculation

$(\text{Dairy operating profit} / \text{Total assets managed}) * 100$

Return on asset managed – including capital appreciation

Return on assets managed, including capital appreciation, measures the profit-generating capacity of the total assets of the business including the growth in the value of these assets. When large companies such as BHP report a RoA, they include the growth in the value of their assets.

Calculation

$((\text{Dairy operating profit} + \text{change in the value of land and improvements}) / \text{Total assets managed}) * 100$

Return on equity - operational

This KPI measures the return on the owner's investment in the business (not including any appreciation in the value of land or improvements). Interest costs, land lease and rent are deducted from the operating profit to make the calculation. It takes the investor's point of view and can be a good way to encourage further investment in a business; it also allows a comparison to be made with the returns available from external investments.

Calculation

$(\text{Net farm income} / \text{Equity}) * 100$

Return on equity (RoE) - including capital appreciation

This KPI takes the RoE operational, discussed above, and adds in the appreciation in the value of land and improvements.

Calculation

(Net farm income + change in the value of land and improvements) / Equity * 100

Operating profit margin

This calculation highlights the amount of profit retained after all expenses are paid except debt servicing and taxation payments. It is a measure of the effectiveness of operations to generate and retain profits from revenues. Depreciation and a management allowance are included as expenses in this profit KPI.

Calculation

(Dairy operating profit / Total gross farm income) * 100

Dairy operating profit per cow

Similar to the above calculation but is expressed as dollars per cow.

Calculation

Dairy operating profit / Number of cows

Solvency KPI used in QDAS

Solvency ratios indicate how the business is financed, e.g. by owner's equity or by external debt. Lenders of long-term funds and equity investors have an interest in solvency ratios. They can highlight:

- Possible problems for the business in meeting its long-term obligations
- Show how much of the business' capital is provided by lenders versus owners
- The asset liability statement will indicate to the lenders the potential risks in the recovery of their money
- The potential amount of long-term funds that a business can borrow.

This KPI is often referred to as the 'sleep at night' factor – how comfortable do you feel with the current debt level?

Equity%

Lenders see an increased risk associated with borrowing as this percentage figure falls below a predetermined or agreed figure. To assess the risk potential it is important to look at both the debt and the business cash flow.

Calculation

((Assets – Liabilities) / Assets) * 100

Debt to equity ratio

This is another way of expressing equity.

Calculation

Liabilities / (Assets – Liabilities)

Efficiency KPI used in QDAS

When examining a business these KPIs are often the starting point in an analysis; however, it is recommended that the emphasis should be on the first three business traits. Efficiency ratios show how well business resources are being used to achieve other KPI.

Efficiency - Capital

Asset turnover ratio (ATO)

This measures the amount of revenue generated per dollar of assets invested. It is a measure of the manager's effectiveness to generate revenues (capital efficiency). The calculation does not include any costs.

Calculation

Total gross farm income / Assets

Total liabilities per cow

A high value could indicate potential difficulties with both liquidity and solvency.

Calculation

Liabilities / Number of cows

Interest per cow

The total amount of dollars being paid in interest per cow is used to highlight one risk aspect for the business. Generally farms in a rapid development phase will have a higher figure than well established businesses.

Calculation

Total interest payments / Number of cows

Efficiency - Production

Feed related cost per litre

Feed related costs are variable cash costs and includes purchased as well as all home grown feed input costs.

Calculation

Total of all feed related costs / Milk sold

Margin over feed related costs per cow

Only the net milk receipts are used in this calculation, which avoids the fluctuations that occur in annual cattle sales.

Calculation

(Net milk receipts – Feed related costs) / Number of cows

Total variable cost per litre

In QDAS total variable costs are compiled under three headings – feed related, herd and shed costs.

Calculation

(Feed related + shed + herd costs) / Milk sold

Gross margin – milk only per cow

This highlights the milk production efficiency; the resulting dollars are available to pay fixed, financial, living and future development costs.

Calculation

(Net milk receipts – Total variable costs) / Number of cows

Efficiency - Physical

Litres of milk from home grown feed

Home grown feed includes grazed pasture, home produced hay and silage. QDAS uses milk conversion factors to calculate the milk from all feed sources including concentrates.

Calculation

The milk from home grown feed is expressed as litres per cow per day

Production per cow

In QDAS the milking cow numbers used in all calculations includes milkers plus dry cows. This implies each cow has a calf annually.

Calculation

Milk sold / Number of cows

Litres per labour unit

The inference is made that as margins have reduced, technology should be used to gain efficiency. The number of cows milked per labour unit will impact on profitability.

Calculation

Total litres of milk / Number of labour units (paid + unpaid)

General comments

Many of these KPI are representative of KPI that are used in most business reporting. A great number of additional KPI can be calculated from the vast amount of data collated in QDAS if and when required.

Other measures are important when examining an individual plan especially liquidity traits e.g. cash surpluses. Environmental KPI and other sustainability considerations are also important.

The change in net worth is also an important indicator for every farm owner, and should be calculated regularly.
